Backend and API

I am a backend and API programmer with extensive experience in developing web applications using various frameworks and languages. I have mastered Django and Django REST Framework (DRF), which I use to create robust, scalable, and secure APIs for different projects. I am also proficient in Node.js and Express, which I use to build fast and efficient web servers and microservices. I have also worked with FastAPI, a modern and high-performance Python framework for building APIs. Additionally, I am familiar with Golang, a powerful and concise language for concurrent and distributed systems. I have also worked with communication protocols such as WebSockets, which enable real-time and bidirectional communication between clients and servers. I am always eager to learn new technologies and improve my skills as a backend and API programmer.

Education

Bachelor's student in computer engineering (active member of the university's computer engineering scientific association)

2022 - Present

Work experience

I have a history of cooperation with Jahrom library, where I developed various APIs for their online services. I used Django and Django REST Framework (DRF) to develop an online exam system and a certification system, which provided online assessment and verification of skills and knowledge.
